:

Checking files and directory details

The following code demonstrates how I used Linux commands to determine the existing permissions set for a directory in the file system.

```
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec 2 15:27 .
-rw--w---- 1 researcher2 research_team
                                46 Dec 2 15:27 .project_x.txt
46 Dec 2 15:27 project_k.txt
-rw-rw-rw- 1 researcher2 research_team
rw-r---- 1 researcher2 research_team
                                46 Dec 2 15:27 project_m.txt
rw-rw-r-- 1 researcher2 research_team
                                46 Dec 2 15:27 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                      2 15:27 project_t.txt
                                46 Dec
esearcher2@5d738f0f927b:~/projects$
```

The first line of the screenshot shows the command I entered, and the other lines show the output. The code lists all contents of the projects directory. I used the ls command with the -la option to display a detailed listing of the file contents that also returned hidden files. The output of my command shows that there is one directory named drafts, one hidden file named .project_x.txt, and five other project files. The 10-character string in the first column represents the permissions set on each file or directory.

Describe the permissions string

The 10-character string can be deconstructed to determine who is authorized to access the file and their specific permissions. The characters and what they represent are as follows:

- **1st character**: This character is either a d or hyphen (-). If it's a d, then it's a directory. If it's a hyphen (-), it's a regular file.
- **2nd-4th characters**: Are user permissions. These characters indicate the read (r), write (w), and execute (x) permissions for the user. When one of these characters is a hyphen (-) not grenated.
- **5th-7th characters:** Are group permissions. These characters indicate the read (r), write (w), and execute (x) permissions for the group. When one of these characters is a hyphen (-) permission is not granted.
- 8th-10th characters: Are other permissions. These characters indicate the read (r), write (w), and execute (x) permissions for other. This owner type consists of all other

users on the system apart from the user and the group. When one of these characters is a hyphen (-) instead, that indicates that this permission is not granted for other.

Change file permissions

The organization determined that other shouldn't have write access to any of their files. To comply with this, I referred to the file permissions that I previously returned. I determined project k.txt must have the write access removed for other.

The following code demonstrates how I used Linux commands to do this:

```
researcher2@5d738f0f927b:~/projects$ chmod o-w project_k.txt
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec
                                            2 15:27 .
-rw--w---- 1 researcher2 research_team
                                    46 Dec 2 15:27 .project_x.txt
drwx--x--- 2 researcher2 research_team 4096 Dec 2 15:27 drafts
rw-rw-r-- 1 researcher2 research_team
                                    46 Dec 2 15:27 project_k.txt
                                     46 Dec
                                            2 15:27 project_m.txt
-rw-r----- 1 researcher2 research team
rw-rw-r-- 1 researcher2 research_team
                                     46 Dec
                                            2 15:27 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                     46 Dec
                                            2 15:27 project_t.txt
researcher2@5d738f0f927b:~/projects$
```

The first two lines of the screenshot display the commands I entered, and the other lines display the output of the second command. The chmod command changes the permissions on files and directories. The first argument indicates what permissions should be changed, and the second argument specifies the file or directory. In this example, I removed write permissions from other for the project_k.txt file. After this, I used ls-la to review the updates I made.

Change file permissions on a hidden file

The research team at my organization recently archived project_x.txt. They do not want anyone to have write access to this project, but the user and group should have read access.

The following code demonstrates how I used Linux commands to change the permissions:

```
researcher2@3213bbc1d047:~/projects$ chmod u-w,g-w,g+r .project_x.txt
researcher2@3213bbc1d047:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec 20 15:36 .
drwxr-xr-x 3 researcher2 research team 4096 Dec 20 15:36 ...
-r--r---- 1 researcher2 research_team
                                         46 Dec 20 15:36 .project_x.txt
drwx--x--- 2 researcher2 research team 4096 Dec 20 15:36 drafts
 rw-rw-rw- 1 researcher2 research_team
                                         46 Dec 20 15:36 project_k.txt
rw-r---- 1 researcher2 research_team
                                         46 Dec 20 15:36 project_m.txt
 rw-rw-r-- 1 researcher2 research_team
                                         46 Dec 20 15:36 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                         46 Dec 20 15:36 project_t.txt
researcher2@3213bbc1d047:~/projects$
```

The first two lines of the screenshot display the commands I entered, and the other lines display the output of the second command. I know $.project_x.txt$ is a hidden file because it starts with a period (.). In this example, I removed write permissions from the user and group, and added read permissions to the group. I removed write permissions from the user with u-w. Then, I removed write permissions from the group with g-w, and added read permissions to the group with g+r.

Change directory permissions

My organization only wants the researcher2 user to have access to the drafts directory and its contents. This means that no one other than researcher2 should have execute permissions.

The following code demonstrates how I used Linux commands to change the permissions:

```
researcher2@5d738f0f927b:~/projects$ chmod g-x drafts
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec
                                                 2 15:27 .
drwxr-xr-x 3 researcher2 research_team 4096 Dec
                                                 2 15:27 ...
-r--r---- 1 researcher2 research_team
                                         46 Dec
                                                 2 15:27 .project_x.txt
drwx----- 2 researcher2 research_team 4096 Dec
                                                 2 15:27 drafts
-rw-rw-r-- 1 researcher2 research team
                                                 2 15:27 project k.txt
                                        46 Dec
rw-r---- 1 researcher2 research_team
                                         46 Dec
                                                 2 15:27 project_m.txt
rw-rw-r-- 1 researcher2 research_team
                                                 2 15:27 project_r.txt
                                         46 Dec
rw-rw-r-- 1 researcher2 research_team
                                         46 Dec
                                                 2 15:27 project_t.txt
researcher2@5d738f0f927b:~/projects$
```

The output here displays the permission listing for several files and directories. Line 1 indicates the current directory (projects), and line 2 indicates the parent directory (home). Line 3

indicates a regular file titled <code>.project_x.txt</code>. Line 4 is the directory (drafts) with restricted permissions. Here you can see that only researcher2 has execute permissions. It was previously determined that the group had execute permissions, so I used the <code>chmod</code> command to remove them. The <code>researcher2</code> user already had execute permissions, so they did not need to be added.

Summary

I changed multiple permissions to match the level of authorization my organization wanted for files and directories in the projects directory. The first step in this was using ls -la to check the permissions for the directory. This enable me to decide in the following steps. I then used the chmod command multiple times to change the permissions on files and directories.
